

# Intelligence applied to business

# Features

## Virtual Assistant

This is a client-centered chatbot that emulates the service offered by a human agent. It is able to understand questions and carry out a variety of transactions quickly and easily.

## Intuitive Interface

It is user-friendly and can be easily operated, either in conversational mode via text input, or enriched mode, aided by quick access buttons to the main features.

## Integration

The chatbot fully interacts with i-Sol, mostly for all insurance related transactions. With a layered architecture, it allows for a streamlined integration with clients' websites and other platforms.

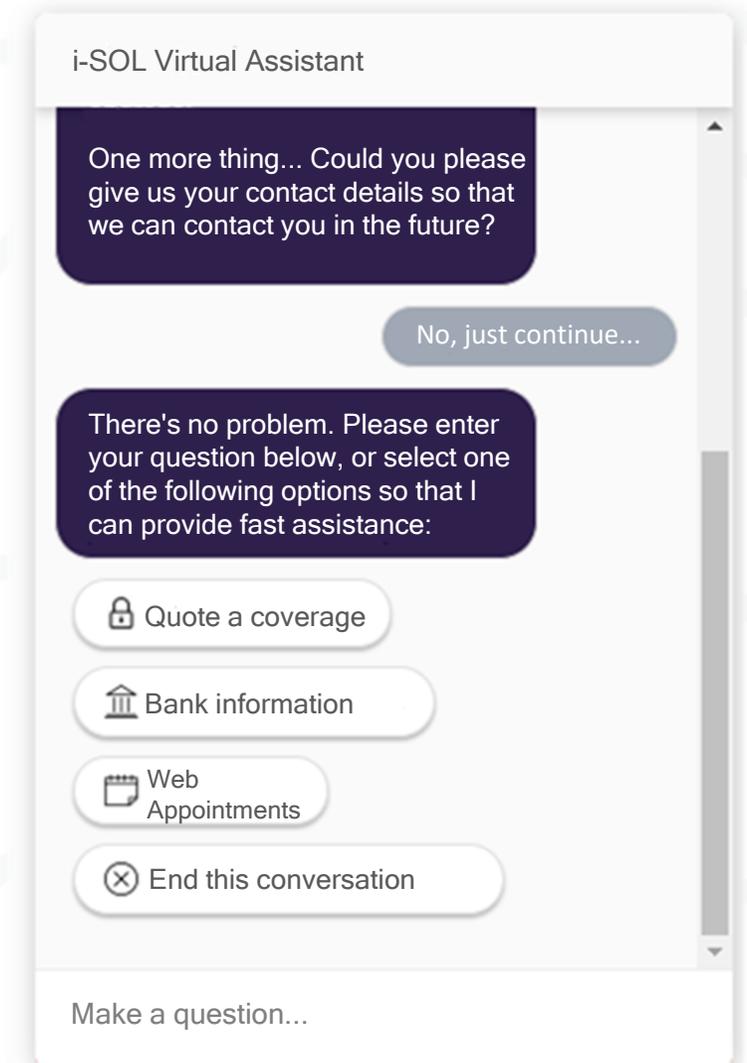

## Artificial Intelligence

The chatbot is equipped with Machine Learning technology that allows for training of the Virtual Assistant, so that it can provide answers to new questions or questions which were not previously understood, and carry out new transactions.

## Flexibility

Both, its interface and circuits can be reconfigured to comply with the institutional design standards and business functions required by each organization.

# Businesses

In a few simple steps, it streamlines the process of contracting of a new insurance policy, offering several plans and allowing the client to choose a payment method, such as credit card or debit from their own accounts.

The data analytic tools and the information collected by i-Sol about the transactions made and quality of care received, provide valuable support for decision-making aimed at generating new businesses and improving customer support.

Using data from i-Sol and UP/CROSS Selling algorithms, the assistant will make customized proposals to the client in order that they improve their coverage plan or contract new types of insurance.
